

When did humans expect AI to help solve a major open math problem?

9 reported group series · 3 survey waves · colored by year conducted

Definitions differ: ESPAI asks about autonomous solutions to long-standing open problems (Millennium is an example). LEAP asks specifically about solving or substantially assisting with a Millennium Prize Problem.

Markers are reported observations; straight joins are visual guides. A lone point is not extended into a curve. ESPAI uses mean fitted CDFs; LEAP uses median probabilities. The 2024 90% date (2822) is retained in the data, outside this view.
